

# VENTILATORS

*We offer medical grade thermoplastic solutions and technical support for critical medical applications to help combat the COVID-19 crisis.*

## **How can we help you?**

RTP Company has developed medical grade compounds that can be used for ventilator parts and components such as:

- Housings, bezels, and electrical components that require UL- 94 flame resistance ratings and the ability to resist cracking from the harsh hospital cleaners
- Internal and external hose connector parts that need to be repeatedly cleaned or steam sterilized
- Hoses and touch handles requiring flexibility and durability
- Internal frames and supports where structural strength is needed

## **The Right Compounds for Your Needs**

Depending on your application requirements, RTP Company can provide the thermoplastic compound that fits your needs. Our portfolio includes compounds that resist the damage caused by harsh chemicals and disinfectants; thermoplastic elastomers for excellent flexibility and durability for “soft touch” surfaces like handles; and Very Long Fiber compounds that offer the best impact performance, creep resistance and surface finish.

## **Material Solutions: Yesterday, Today, and Tomorrow**

We have always been committed to providing material solutions to solve even the most challenging application requirements. During these unprecedented and uncertain times, we are partnering with you to fight the COVID-19 battle with materials that provide solutions today... and beyond.
